

IN THE CLAIMS:

Please **AMEND** claims 1, 17, 18, 30, 37, 50, 55, and 56, as follows:

1. (CURRENTLY AMENDED) A disc cartridge having a disc where information is recorded and/or reproduced using a disc drive with a probing portion, comprising
a case to rotatably accommodate the disc; and
an identification unit disposed on said case to identify a type of the disc using the probing portion of the disc drive,
wherein the probing portion is selectively pressed by said identification unit to produce a ~~predetermined~~ sequence of information to determine the type of the disc, the sequence of information being produced as elements of the sequence are sequentially detected by the probing portion as the case moves past the probing portion.

2. (PREVIOUSLY PRESENTED) A disc cartridge having a disc where information is recorded and/or reproduced using a disc drive with a probing portion, comprising
a case to rotatably accommodate the disc; and
an identification unit disposed on said case to identify a type of the disc using the probing portion of the disc drive,
wherein:
the probing portion selectively detects said identification unit to produce a predetermined sequence of information to determine the type of the disc, and
said identification unit comprises:
an identification opening; and
an identification plate slideably installed in the identification opening.

3. (ORIGINAL) The disc cartridge as claimed in claim 2, wherein:
the identification opening comprises guide grooves having corresponding hooking steps formed at corresponding ends of the identification opening, and
the identification plate comprises hooking portions, wherein each of the hooking portions hooks one of the hooking steps to fix the identification plate at one of the ends of the identification opening.

4. (ORIGINAL) The disc cartridge as claimed in claim 2, wherein the identification plate further includes an adjustment hole at the center of the identification plate, wherein the identification plate slides by inserting a sharpened tip into the adjustment hole.

5. (ORIGINAL) The disc cartridge as claimed in claim 2, wherein said identification unit further comprises additional identification openings having additional corresponding identification plates.

6. (ORIGINAL) The disc cartridge as claimed in claim 2, wherein
said case comprises an upper case and a lower case,
said identification unit further comprises an additional identification opening and
corresponding additional identification plate, and
each of the upper case and the lower case includes one of the identification openings
and corresponding identification plates.

7. (ORIGINAL) The disc cartridge as claimed in claim 3, wherein
said case comprises an upper case and a lower case,
said identification unit further comprises an additional identification opening and
corresponding additional identification plate, and
each of the upper case and the lower case includes one of the identification openings
and corresponding identification plates.

8. (ORIGINAL) The disc cartridge as claimed in claim 4, wherein
said case comprises an upper case and a lower case,
said identification unit further comprises an additional identification opening and
corresponding additional identification plate, and
each of the upper case and the lower case includes one of the identification openings
and corresponding identification plates.

9. (ORIGINAL) The disc cartridge as claimed in claim 5, wherein
said case comprises an upper case and a lower case,
said identification unit further comprises an additional identification opening and
corresponding additional identification plate, and

each of the upper case and the lower case includes one of the identification openings and corresponding identification plates.

10. (ORIGINAL) The disc cartridge as claimed in claim 2, wherein said case comprises a top surface parallel with an information recording surface of the disc and a side surface adjacent the top surface, and the identification opening is provided at the side surface of said case.

11. (ORIGINAL) The disc cartridge as claimed in claim 3, wherein said case comprises a top surface parallel with an information recording surface of the disc and a side surface adjacent the top surface, and the identification opening is provided at the side surface of said case.

12. (ORIGINAL) The disc cartridge as claimed in claim 4, wherein said case comprises a top surface parallel with an information recording surface of the disc and a side surface adjacent the top surface, and the identification opening is provided at the side surface of said case.

13. (ORIGINAL) The disc cartridge as claimed in claim 5, wherein said case comprises a top surface parallel with an information recording surface of the disc and a side surface adjacent the top surface, and the identification opening is provided at the side surface of said case.

14. (ORIGINAL) A disc drive apparatus to drive a disc rotatably accommodated in a disc cartridge having identification plates, comprising:

a recording/reproduction unit to record and/or reproduce information with respect to the disc rotatably accommodated in the disc cartridge; and

a probing portion to selectively detect the identification plates provided at the disc cartridge to produce a sequence of information to identify a type of the disc.

15. (ORIGINAL) The disc cartridge as claimed in claim 14, wherein said probing portion comprises:

a probing rod to contact the identification plates,
a probing sensor installed at the probing rod, and

a probing switch which is turned one of ON and OFF due to a movement by the probing sensor.

16. (ORIGINAL) A disc identification mechanism to identify a type of a disc in a disc cartridge using a disc drive to record and/reproduce information on the disc and having a probing portion, the mechanism comprising:

identification openings installed at the disc cartridge, each said identification opening having an identification plate slideably attached therein; and

a probing portion installed at the disc drive to identify the type of the disc by detecting positions of the identification plates,

wherein a contact between said probing portion and the identification plates produces a sequence of information to identify the type of the disc.

17. (CURRENTLY AMENDED) A disc cartridge having an information recording medium and which is received by an apparatus having a probing portion, comprising:

a case having sides defining an inner space to accommodate the information recording medium therein and an opening/closing member which opens and closes an opening through which the information recording medium is accessed, ~~the case having a first one of the sides being disposed above or below and extending across at least a portion of a recording surface of the information recording medium; and~~

identification units disposed on the first side of said case, each of the identification units being detected by a common element of the probing portion such that to be sequentially detected by the probing portion of the apparatus to produces a predetermined sequence of information to determine a type of the information recording medium.

18. (CURRENTLY AMENDED) The disc cartridge of claim 17, wherein the sequence of the information is produced ~~by a relative motion between~~ as said identification units move relative to and the probing portion such that corresponding elements of the sequence are sequentially detected.

19. (ORIGINAL) The disc cartridge of claim 17, wherein said identification units are disposed on said case in a line such that the probing portion detects said identification units during insertion into the apparatus.

20. (PREVIOUSLY PRESENTED) The disc cartridge of claim 17, wherein said identification units are detectable by contact with a common tip of the probing portion.

21. (PREVIOUSLY PRESENTED) A disc cartridge having an information recording medium and which is received by an apparatus having a probing portion, comprising:
a case to accommodate the information recording medium; and
identification units disposed on said case to be sequentially detected by the probing portion of the apparatus to produce a predetermined sequence of information to determine a type of the information recording medium,
wherein:
the sequence of the information is produced by a relative motion between said identification units and the probing portion,
each of said identification units comprises an identification opening having an identification plate disposed therein, and
a position of the identification plate is detected by the probing portion to indicate a feature used to identify the type of the information recording medium.

22. (ORIGINAL) The disc cartridge of claim 21, wherein the identification plates are slideably disposed in the identification openings, and are fixed in the positions to indicate the type of the information recording medium.

23. (ORIGINAL) The disc cartridge of claim 22, wherein each of said identification units further comprises:

a first interlocking piece disposed at one of the identification plate and the identification opening, and

a second interlocking piece to interlock with the first interlocking piece disposed at the other one of the identification plate and the identification opening.

24. (ORIGINAL) The disc cartridge of claim 23, wherein:

the first interlocking piece comprises a hooking portion, and

the second interlocking piece comprises a groove to securely receive the hooking portion.

25. (ORIGINAL) The disc cartridge of claim 24, wherein the hooking portion is disposed on the identification plate, and the groove is in said case.

26. (ORIGINAL) The disc cartridge of claim 17, further comprising a first positioning unit disposed on said case to be received by a second positioning unit disposed on the apparatus to position the disc cartridge in the apparatus.

27. (ORIGINAL) The disc cartridge of claim 19, further comprising a first positioning unit disposed on said case to be received by a second positioning unit disposed on the apparatus to position the disc cartridge after being inserted into the apparatus.

28. (ORIGINAL) The disc cartridge of claim 27, wherein said first positioning unit comprises a positioning hole and the second positioning unit comprises a positioning pin to be received into the positioning hole.

29. (CANCELED)

30. (CURRENTLY AMENDED) A disc cartridge having an information recording medium and which is received by an apparatus having a probing portion, comprising:

a case to accommodate the information recording medium; and

identification units disposed on said case to be sequentially detected by the probing portion of the apparatus to produce a ~~predetermined~~ sequence of information to determine a type of the information recording medium,

wherein:

the sequence of the information is produced by a relative motion between said identification units and the probing portion,

said case further comprises a top side disposed above or below a recording surface of the information recording medium, and a second side disposed adjacent the top side, and

said identification units are disposed on the second side.

31. (PREVIOUSLY PRESENTED) A disc drive apparatus to record and/or reproduce data with respect to an information recording medium disposed in a disc cartridge having identification units, the apparatus comprising:

a turntable to receive the information recording medium;
a motor to drive said turntable to turn the information recording medium;
an optical pickup to record and/or reproduce data with respect to the information recording medium;
a controller to control said motor and said optical pickup according to a type of the information recording medium; and
a probing portion to be sequentially pressed by the identification units of the disc cartridge to detect information from the identification units, and to provide the detected information to said controller,
wherein said controller determines the type of the information recording medium according to the detected information.

32. (ORIGINAL) The disc drive apparatus of claim 31, wherein the detected information is in a sequence produced by a relative motion between the identification units and said probing portion.

33. (ORIGINAL) The disc drive apparatus of claim 31, wherein the identification units are disposed on the disc cartridge in a line such that said probing portion detects the identification units during insertion into the disc drive apparatus.

34. (ORIGINAL) The disc drive apparatus of claim 31, further comprising a tray to receive the disc cartridge, wherein said probing portion detects the identification units as the identification units pass by said probing portion while said tray moves the disc cartridge.

35. (ORIGINAL) The disc drive apparatus of claim 31, wherein said probing portion comprises a tip, wherein the tip detects the identification units.

36. (ORIGINAL) The disc drive apparatus of claim 32, wherein said probing portion detects a position of an identification plate of each identification unit to indicate a feature used by said controller to identify the type of the information recording medium.

37. (CURRENTLY AMENDED) A disc drive apparatus to record and/or reproduce data with respect to an information recording medium disposed in a disc cartridge having sides defining an inner space to accommodate the information recording medium therein, an

opening/closing member which opens and closes an opening, and having identification units on at least a top one of the sides, the apparatus comprising:

- a turntable to receive the information recording medium;
- a motor to drive said turntable to turn the information recording medium;
- an optical pickup to record and/or reproduce data with respect to the information recording medium;
- a controller to control said motor and said optical pickup according to a type of the information recording medium; and
- a probing portion to sequentially detect the identification units of the disc cartridge, and to provide the detected information to said controller,

wherein:

- said controller determines the type of the information recording medium according to the detected information,
- the detected information is in a sequence produced by a relative motion between the identification units and said probing portion, and
- said probing portion is disposed on the disc drive apparatus to detect the identification units disposed on ~~a~~the top side of the disc cartridge, and the top side is disposed above or below and extends at least partially across a recording surface of the information recording medium.

38. (PREVIOUSLY PRESENTED) A disc drive apparatus to record and/or reproduce data with respect to an information recording medium disposed in a disc cartridge having identification units, the apparatus comprising:

- a turntable to receive the information recording medium;
- a motor to drive said turntable to turn the information recording medium;
- an optical pickup to record and/or reproduce data with respect to the information recording medium ;
- a controller to control said motor and said optical pickup according to a type of the information recording medium; and
- a probing portion to sequentially detect the identification units of the disc cartridge, and to provide the detected information to said controller,

wherein:

- said controller determines the type of the information recording medium according to the detected information,

the detected information is in a sequence produced by a relative motion between the identification units and said probing portion, and

said probing portion is disposed on the disc drive apparatus to detect the identification units disposed on a side of the disc cartridge adjacent to a top side that is disposed above or below a recording surface of the information recording medium.

39. (PREVIOUSLY PRESENTED) A disc drive apparatus to record and/or reproduce data with respect to an information recording medium disposed in a disc cartridge having identification units, the apparatus comprising:

a turntable to receive the information recording medium;

a motor to drive said turntable to turn the information recording medium;

an optical pickup to record and/or reproduce data with respect to the information recording medium;

a controller to control said motor and said optical pickup according to a type of the information recording medium;

a probing portion to sequentially detect the identification units of the disc cartridge, and to provide the detected information to said controller; and

a tray to receive the disc cartridge, said tray including a guide groove to receive said probing portion,

wherein:

said controller determines the type of the information recording medium according to the detected information,

the detected information is in a sequence produced by a relative motion between the identification units and said probing portion, and

said probing portion is guided by the guide groove and detects the identification units as the identification units pass by said probing portion while said tray moves the disc cartridge.

40. (ORIGINAL) The disc drive apparatus of claim 31, wherein said probing portion comprises a probing sensor and a probing tip, where the probing tip detects states of each of the identification units and the probing sensor provides the detected states to said controller as the detected information.

41. (PREVIOUSLY PRESENTED) A disc drive apparatus to record and/or reproduce data with respect to an information recording medium disposed in a disc cartridge having identification units, the apparatus comprising:

a turntable to receive the information recording medium;

a motor to drive said turntable to turn the information recording medium;

an optical pickup to record and/or reproduce data with respect to the information recording medium;

a controller to control said motor and said optical pickup according to a type of the information recording medium; and

a probing portion to sequentially detect the identification units of the disc cartridge, and to provide the detected information to said controller,

wherein:

said controller determines the type of the information recording medium according to the detected information,

the probing sensor detects a first state if the probing tip contacts an identification plate of the identification unit, and

the probing sensor detects a second state if the probing tip detects an identification opening of the identification unit and does not contact the identification plate of the identification unit.

42. (PREVIOUSLY PRESENTED) A method of detecting a type of an information recording medium disposed within a disc cartridge using a probing portion of an apparatus, comprising:

passing a first identification unit of the disc cartridge by the probing portion and detecting a first feature of the information recording medium from the first identification unit being pressed using the probing portion;

passing a second identification unit of the disc cartridge by the probing portion and detecting a second feature of the information recording medium from the second identification unit being pressed using the probing portion; and

determining a type of the information recording medium based upon the detected first and second features.

43. (PREVIOUSLY PRESENTED) A method of detecting a type of an information recording medium disposed within a disc cartridge using a probing portion of an apparatus, comprising:

passing a first identification unit of the disc cartridge by the probing portion and detecting a first feature of the information recording medium from the first identification unit using the probing portion;

passing a second identification unit of the disc cartridge by the probing portion and detecting a second feature of the information recording medium from the second identification unit using the probing portion; and

determining a type of the information recording medium based upon the detected first and second features,

wherein:

- said passing and detecting the first feature comprises detecting a position of a first identification plate of the first identification unit, and

- said passing and detecting the second feature comprises detecting a position of a second identification plate of the second identification unit.

44. (ORIGINAL) The method of claim 43, wherein:

the probing portion comprises a probing tip;

said passing and detecting the first feature comprises:

producing an ON state of the probing portion if the probing tip contacts the first identification plate as the first identification unit passes by the probing portion, and

producing an OFF state of the probing portion if the probing tip detects an opening adjacent the first identification plate as the first identification unit passes by the probing portion;

said passing and detecting the second feature comprises

producing an ON state of the probing portion if the probing tip contacts the second identification plate as the second identification unit passes by the probing portion, and

producing an OFF state of the probing portion if the probing tip detects an opening adjacent the second identification plate as the second identification unit passes by the probing portion; and

said determining the type of the information recording medium comprises detecting a sequence of the ON and OFF states of the probing portion as the probing portion passes the

first and second identification units, and matching the sequence to one of predetermined sequences corresponding to types of information recording media.

45. (PREVIOUSLY PRESENTED) A computer readable medium encoded with processing instructions for implementing a method of detecting a type of information recording medium disposed in a disc cartridge performed by a computer, the method comprising:

receiving a first information signal in response to a first identification unit of the disc cartridge passing by a probing portion of an apparatus and detecting a first feature of the information recording medium from the first identification unit being pressed using the probing portion;

receiving a second information signal in response to a second identification unit of the disc cartridge passing by the probing portion and detecting a second feature of the information recording medium from the second identification unit being pressed using the probing portion; and

determining a type of the information recording medium based upon the detected first and second features.

46. (PREVIOUSLY PRESENTED) A computer readable medium encoded with processing instructions for implementing a method of detecting a type of information recording medium disposed in a disc cartridge performed by a computer, the method comprising:

receiving a first information signal in response to a first identification unit of the disc cartridge passing by a probing portion of an apparatus and detecting a first feature of the information recording medium from the first identification unit using the probing portion;

receiving a second information signal in response to a second identification unit of the disc cartridge passing by the probing portion and detecting a second feature of the information recording medium from the second identification unit using the probing portion; and

determining a type of the information recording medium based upon the detected first and second features,

wherein:

said receiving the first information signal comprises receiving the first information signal in response to the probing portion detecting a position of a first identification plate of the first identification unit, and

said receiving the second information signal comprises receiving the second information signal in response to the probing portion detecting a position of a second identification plate of the second identification unit.

47. (ORIGINAL) The computer readable medium of claim 46, wherein:

the probing portion comprises a probing tip;

said receiving the first information signal comprises:

receiving an ON state of the probing portion if the probing tip contacts the first identification plate as the first identification unit passes by the probing portion, and

receiving an OFF state of the probing portion if the probing tip detects an opening adjacent the first identification plate as the first identification unit passes by the probing portion;

said receiving the second information signal comprises

receiving an ON state of the probing portion if the probing tip contacts the second identification plate as the second identification unit passes by the probing portion, and

receiving an OFF state of the probing portion if the probing tip detects an opening adjacent the second identification plate as the second identification unit passes by the probing portion: and

said determining the type of the information recording medium comprises detecting a sequence of the ON and OFF states of the probing portion as the probing portion passes the first and second identification units, and matching the sequence to one of predetermined sequences corresponding to types of information recording media.

48. (ORIGINAL) The computer readable medium of claim 45, further comprising:

controlling a reading and/or writing operation of a disc drive apparatus in accordance with the determined type of the information recording medium.

49. (ORIGINAL) The computer readable medium of claim 47, further comprising:

controlling a reading and/or writing operation of a disc drive apparatus in accordance with the determined type of the information recording medium.

50. (CURRENTLY AMENDED) An apparatus to identify a type of information recording medium, comprising:

a probing portion;

a case to accommodate the information recording medium;

identification units disposed on said case to be sequentially detected by said probing portion individually pressing the identification units as each identification unit moves past the probing portion to sequentially detect corresponding individual elements of a sequence of information so as to produce the a-predetermined-sequence of information; and

a detection unit to determine the type of the information recording medium using the predetermined-produced sequence of information.

51. (ORIGINAL) The apparatus of claim 50, wherein the sequence of the information is produced by a relative motion between said identification units and said probing portion.

52. (ORIGINAL) The apparatus of claim 50, wherein said identification units are disposed on said case in a line such that said probing portion detects said identification units during insertion into the apparatus.

53. (ORIGINAL) The apparatus of claim 50, wherein said identification units are detectable by a common tip of said probing portion.

54. (PREVIOUSLY PRESENTED) An apparatus to identify a type of information recording medium, comprising:

a probing portion;

a case to accommodate the information recording medium;

identification units disposed on said case to be sequentially detected by said probing portion to produce a predetermined sequence of information; and

a detection unit to determine the type of the information recording medium using the predetermined sequence of information,

wherein:

each of said identification units comprises an identification opening having an identification plate disposed therein, and

positions of the identification plates are detected by said probing portion to indicate features used by said detection unit to identify the type of the information recording medium.

55. (CURRENTLY AMENDED) An apparatus to identify a type of information recording medium, comprising:

a probing portion;

a case having sides defining an opening to accommodate the information recording medium therein, and an opening/closing member which opens and closes an opening through which the information recording medium is accessed, with and including a top one of the sides extending at least partially across the information recording medium;

identification units disposed on at least the top side of said case to be sequentially detected by said probing portion to produce a ~~predetermined~~ sequence of information; and

a detection unit to determine the type of the information recording medium using the ~~predetermined~~ produced sequence of information,

wherein:

the sequence of the information is produced by ~~a relative motion between said identification units and moving past said probing portion~~ such that elements of the sequence of information are sequentially detected, and

the top side is disposed above or below a recording surface of the information recording medium, ~~and said identification units are disposed on the top side.~~

56. (PREVIOUSLY PRESENTED) An apparatus to identify a type of information recording medium, comprising:

a probing portion;

a case to accommodate the information recording medium;

identification units disposed on said case to be sequentially detected by said probing portion to produce a predetermined sequence of information; and

a detection unit to determine the type of the information recording medium using the predetermined sequence of information,

wherein:

the sequence of the information is produced by a relative motion between said identification units and said probing portion,

said case further comprises a top side disposed above or below a recording surface of the information recording medium, and a second side disposed adjacent the top side, and

said identification units are disposed on the second side.

57. (ORIGINAL) The apparatus of claim 50, wherein said probing portion comprises a probing sensor and a probing tip, where the probing tip detects states of each of said identification units and the probing sensor provides the detected states to said detection unit.

58. (PREVIOUSLY PRESENTED) An apparatus to identify a type of information recording medium, comprising:

a probing portion;

a case to accommodate the information recording medium;

identification units disposed on said case to be sequentially detected by said probing portion to produce a predetermined sequence of information; and

a detection unit to determine the type of the information recording medium using the predetermined sequence of information,

wherein:

the probing portion comprises a probing sensor and a probing tip, where the probing tip detects states of each of said identification units and the probing sensor provides the detected states to said detection unit,

the probing sensor detects a first state if the probing tip contacts an identification plate of said identification unit, and

the probing sensor detects a second state if the probing tip detects an identification opening of said identification unit and does not contact the identification plate of said identification unit.
